MORTUARY REPORT

FOR THE YEAR 1855.

In March 1853, the Medical Board while reporting upon the sanatory condition of Madras and suburbs pointed out to Government the necessity for establishing Returns of Births and Deaths in each Division of the Town; after communicating with the Chief Magistrate as per letter appended, the measure as regards Mortuary Returns was established and brought into operation on 1st January 1855. It would appear impracticable at the present time to obtain returns of births. The following tables have been framed from the individual reports and registers received during 1855. The form of reports called for, immediately precedes the tables.

2. The town of Madras and suburbs was divided into certain districts or divisions by the Chief Magistrate; a list of these is also given.

No. 1170.

To THE CHIEF MAGISTRATE AND SUPERINTENDENT OF POLICE.

SIR,

With reference to Extract Minutes of Consultation Judicial department No. 567 of date 12th Instant and adverting to the correspondence noted in the margin, relative to the establishment of a registration of deaths and births at Madras, I have the honor under instructions from the Medical Board to submit forms of reports and registers which in their opinion will elicit every requisite information, and they trust these forms will meet with your approval.

Board's letter to Government No. 74 of date 31st March 1853, Extract Minutes of Consultation Public Department No. 454 6th May 1853.

2. The Board will adopt the requisite means to insure accurate information as to those individuals who may die in the several Public institutions at the Presidency; a report duly filled up will be given to one of the friends for the purpose of being handed to the conicopoly of your department at the burying or burning ground. The reports for those taken to the medical college will be sent direct to this office.

3. Medical men generally in Madras, belonging to the service as well as private practitioners, will be provided with a supply of blank reports, and will be requested to afford the requisite information as to the deaths that may occur under their care.

4. The registration will of course include not only natives but Europeans and east indians also.

(Signed) A. LORIMER, M. D.,

Secretary Medical Board.

24th August 1854.

P. S. It is probable that some difficulty may be experienced in obtaining information on some of the points, but this may in time be overcome. The forms have been drawn up so as to afford very ample means of obtaining returns that will be peculiarly valuable in a statistical point of view.

I have, &c.,

(Signed) A. LORIMER, M. D.

No.

MADRAS, GENERAL POLICE OFFICE,
31ST AUGUST 1854.

FROM E. F. ELLIOT, ESQ.,
Chief Magistrate and Superintendent of Police.

TO ALEXANDER LORIMER, ESQ., M.D,
Secretary Medical Board.

SIR,

With reference to your letter No. 1170 of the 24th Instant, I have the honor to state that the Forms and Registers proposed by you, appear, to contain all that is required, though in some points they will never be very accurate. Such as age and cause of death, and in general the duration of disease will be imperfectly procured. However these Forms may be modified hereafter when experience has been obtained.

With regard to Births, I apprehend that the returns will be extremely deficient: especially as regards the Mahommedan population; and then there are one or two points in the form which will never be obtained satisfactorily; such as illegitimacy, the number of the child, the age of father and mother, &c., but the attempt shall be made.

The establishment required by the Police department for these purposes has been recommended for the sanction of the Supreme Government, and when obtained it will take about a month for the men so employed to make themselves masters of the several districts in which they are to work; for the Mahommedans bury any where or every where. Pariahs much the same; the burning grounds are numerous. All parties connected with these different places must be discovered and registered, before we attempt to work systematically. In all Christian burial grounds there will be no difficulty. Under these circumstances I apprehend that it will not be in my power to commence operations before the 1st of January next.

I have, &c.,

(Signed) E. F. ELLIOT,
Chief Magistrate and Superintendent of Police.

No. 238.

TO THE CHIEF SECRETARY TO GOVERNMENT.

SIR,

With reference to Extract from Minutes of Consultation No. 567, Judicial department of date 12th ultimo, and adverting to the correspondence marginally noted, relative to the establishment of a registration of deaths and births at Madras, I have the honor by desire of the Medical Board to acquaint you, that agreeably to the order of Government forms of reports and of registers of births and deaths were submitted by the Board to the Chief Magistrate, and to forward that officer's report thereon, for the information of Government.

Board's letter to Government No. 74 of 1853. Extract Minutes of Consultation P. D. No. 454, 6th May 1853.

2. I am desired to forward these forms for the consideration of Government, and if approved of, to convey the Board's request that (40,000) forty thousand of each form may be printed and transmitted to this office for disposal as required, and that (24) twenty-four registers each of 24 sheets of demi sized paper, may be printed; 12 for the Mortuary Register, and 12 for that of Births.

3. I am desired further to observe that the information obtained by these registers will be condensed in tables and prepared for publication in this office; and for this purpose, the Board respectfully request that they may be permitted to entertain two additional writers. Government will observe that the Chief Magistrate does not expect to be able to commence operations until 1st January next, so that these writers will not be required till that period.

4. In the 2nd 3rd, 4th paras and postscript of the Board's letter to the Chief Magistrate No. 1170 on the subject of the Mortuary, &c., returns, the arrangements proposed for obtaining every requisite information are given, and the Board trust that, though at first the returns may be imperfect and to a certain degree inaccurate, in due course of time when the population get acquainted with the importance of such information and with the object in view, the returns will be as complete as can be expected.

I have, &c.,

(Signed) A. LORIMÉR, M. D.

8th September 1854.

---

3. Immediately on receipt of the printed forms of reports for deaths, every medical man at the Presidency was supplied with a certain number for the purpose of being filled up on casualties occurring in their practice; these forms were also distributed by the Police authorities to those individuals in charge of native burying and burning grounds, and on the whole the information given in these reports has been found pretty accurate and fully more in detail than could have been expected; a good many errors detected in the examination of the monthly registers in this office were corrected in communication with the Police office.

4. In preparing the monthly return, the classification of diseases given in the Bombay returns has been adopted. It was considered however of importance to exhibit the eruptive febrile diseases separately, and also to give bowel complaints, diarrhœa and dysentery a prominent place in the return on account of the comparatively great amount of mortality from these diseases, contrasted with other affections of the stomach and bowels; it was also found on examining the returns that it would be desirable for the same reason to exhibit prominently the mortality in infancy both immediately after birth and for a certain period after the first month.

5. In these monthly returns, Europeans (including Eurasians) Hindoos and Mahommedans have been classed separately, and are marked 1-2 and 3 for each month. The first column of figures refer to the class of disease, the second column also of figures gives the number of casualties under each class of disease or specific disease; the body of the table exhibits the casualties, Male and Female, at the various ages specified.

6. Tables marked 4 (three in number for Europeans, Hindoos and Mahommedans) exhibit the total deaths at each age and from each class of disease for the twelve months, with the proportion of male to every 100 female casualties. Tables marked 5 (also three in number) exhibit the casualties in each month and arranged also in quarters; with the proportion of per centage under each class of disease, also male and female, worked on the total number of casualties, male and female, in the quarter.

7. Table No. 6 gives a concise view of the results of tables 1, 2 and 3 arranged monthly, and shewing the casualties from each class of disease, the general total during the year, and the monthly average. The influence of epidemic disease is clearly seen in this view; appended to table No. 6 is an abstract of the same, showing the total casualties amongst Europeans, Hindoos and Mahommedans monthly, and the ratio per thousand to estimated population (7,20,000), inclusive and also exclusive of Epidemics.

8. From this table it will be observed that the greatest mortality occurs in the months of September, October, January, February, November and December, that is the change of the season and during the N. E. Monsoon; this excess of mortality during the months mentioned, is owing to the prevalence of epidemic fever, cholera and small pox. April, May, June and July, the hottest months of the year, would appear to be the most healthy.

9. Table No. 7 exhibits the number and proportion of casualties at *different ages* amongst all classes for the year. The monthly and daily number of casualties from each class of disease are also shewn and the average; from which it will be seen that the monthly number of deaths registered has been 886, and the daily number a little above 29. The proportion of deaths in this table at each age is the relative per centage to the total under each class of disease; for example, in the first line head Cholera, as 1,956 (the total deaths) is to one hundred; 6 at 1 to 6 months is about the 3rd part of a unit or 0·3. Cholera, fever, bowel complaints, small pox and diseases of the lungs appear to be the most fatal diseases; casualties in infancy and early after birth are numerous and especially from convulsions.

10. The deaths from cholera and fever are very nearly equal, the proportion from the former to the whole mortality being 18·41 and from the latter 16·27. It may be proper however to direct attention to the difference exhibited amongst Europeans, Hindoos and Mahommedans from these diseases in the three tables marked No. 5; amongst the Europeans the proportion of deaths from cholera is 8·90, and from fever 14·45; amongst the Hindoos the proportion of deaths from cholera is 17·74 and from fever 16·70; amongst the Mahommedans the proportion of deaths from cholera is 26·18, and from fever 13·7. From bowel complaints, dysentery and diarrhœa amongst Europeans the ratio of deaths is 12· and 6½ per cent respectively; amongst Hindoos the proportion is 11· and 3·75, and amongst the Mahomedans 10·50 and 3·25. From variola amongst Europeans, the proportion of mortality is only 2· per cent, while amongst the Hindoos it is 8·25, and 7 amongst the Mahommedans; thus shewing that the European portion of the population is more generally protected by vaccination. From pulmonary affections the proportion of deaths amongst Europeans is 9 per cent; amongst Hindoos 6·50 and Mahomedans 7 per cent. It is worthy of remark that the mortality amongst Hindoo females from affections of the brain considerably exceeds the proportion amongst males from the same disease; which probably may be attributed partly to their carrying burdens on the head and partly to their going about with the head uncovered.

11. Table No. 8 exhibits the mortality in the various localities or districts in each month from each class of disease. No. 9 gives a summary view of the preceding with the monthly proportion of deaths.

12. Table No. 10 gives a concise view of the deaths from the different causes in the several localities, with the proportion from each disease in each locality; it shews clearly those localities which are most obnoxious to out-breaks of epidemic disease and other serious ailments; cholera, fever, small pox and bowel complaints, have been most prevalent in Peddoo Naick's pettah (2nd Division of Black Town) marked B, Tondiarpet and Royapooram marked G, Vepery marked F, and Triplicane marked C, all which localities have been frequently brought to notice as being the most unhealthy parts of the Presidency.

13. These parts of Madras are very crowded, ill ventilated and badly drained; the water used by many of the inhabitants is impregnated with animal matter; all which must favor the extension of epidemic and other diseases.

14. It is to be regretted that, with regard to the existing population of Madras, the estimated number of the whole is only available; the number even approximately of the European, Hindoo and Mahommedan population cannot be obtained, otherwise greatly more interesting and valuable returns could easily be framed.

15. Under the head "sudden death" one hundred cases have been recorded; the nature of the disease in these cases is not known; in many, it is supposed that death has resulted from disease of the heart and large vessels connected therewith, and in others from apoplexy, but it would appear desirable that these cases should be investigated by the Coroner.

16. As already mentioned the population of Madras and the suburbs amounts to 720,000; it is calculated that the number of births annually (at the rate of three for every hundred of the population) must be fully 21,000. The number of deaths reported amount only to 10,627—little more than one half of the actual number that must have occurred;—this shews the necessity of continued attention to the subject on the part of the police authorities and also of the several medical practitioners at the Presidency.

A. LORIMER, M. D.,

Secretary Medical Board.

MORTUARY REPORT

FOR THE YEAR 1856.

The Mortuary Tables and Returns for 1856, have been prepared in the same manner as those of the preceding year; the total number of Deaths registered has been 8,433, shewing a decrease of 2,194 compared with the Returns for 1855, in which year 10,627 Deaths were recorded.

2nd. This decrease has been occasioned almost solely by the less prevalence of disease in an Epidemic form, Cholera, Small-pox, and Fever; and Bowel complaints, Diarrhœa and Dysentery. The year was a remarkably healthy one, as observed in the Report on the Civil dispensaries for 1856. The Presidency or Town of Madras enjoyed a very great immunity from epidemic disease. Certain localities notoriously obnoxious to severe out-breaks of cholera have been comparatively exempt, and otherwise healthy during the year. In some of these localities alluded to, Triplicane, and Choolay in Vepery district, great improvements have been lately accomplished. New roads opened, old ones widened, and the drainage has been greatly improved; excessive vegetation has also been removed. All which must have exerted a beneficial influence on the public health. In due time similar improvements will be effected throughout all the other districts of the town. As bearing upon the general health of the Presidency it was further remarked in the above Report, that employment had continued abundant during the year, and was productive of great good to the laboring poor; as much of the misery attendant upon scarcity and high prices of provisions, was thereby greatly alleviated.

September.
October.
November.
December.
January and
February.

3rd. It has been long ascertained, that the most severe out-breaks of epidemic disease have been experienced for the most part in the months marginally noted; and in this respect the returns contrast most strikingly with those of the preceding year. Only seven casualties from cholera appear in the mortuary registers for September, October, November, and December; the deaths during the corresponding months of the preceding year are marginally given. It may here be observed in corroboration of the correctness of the mortuary returns, as regards the statement now made, that the medical reports and returns of the various hospitals and dispensaries at the Presidency, do not exhibit a single casualty from cholera during these four months.

September 390 deaths from Cholera.
October 358 do.
November 207 do.
December 112 do.

4th. The following Table (marked 1) will shew at a glance the difference in the number of deaths in the several districts of the town and suburbs, for the years 1855 and 1856; by the General returns it would appear that comparatively, the mortality continues greatest in Peddoonaickpettah, Triplicane, Big Parcherry, Vepery and Choolay, and Tondiarpettah. Much remains to be done in the way of ventilation, drainage, and sewerage in these localities, and especially in providing a supply of *good drinking water.*

5th. As already observed the decrease in the number of deaths is attributable to the less prevalence of epidemic disease, and bowel complaints allied thereto; this will be clearly seen in the following table (marked 2), wherein the deaths from the diseases therein named, occurring in the several districts during the two years, are contrasted.

7th. A series of years must elapse before accurate deductions on several points, can be drawn from the Mortuary Returns, and therefore this will not now be attempted. Meanwhile it will be necessary for the Police authorities and the medical practitioners at the presidency to give their continued attention to the subject, to ensure not only accuracy in the individual death reports, but also that their reports be duly forwarded from the several burning and burial grounds for record.

Fort Saint George,
Office of the Director General,
Medical Department,
4th June 1858.

A. LORIMER, M. D.,
Secretary to the Director General,
Medical Department.

MORTUARY REPORT

FOR 1857.

1 The Tables and Returns for 1857 have been prepared in the same plan as those of the preceding years. The total number of deaths registered has been 6,968 or 2,562 below the average of the two years 1855 and 1856.

2. This decrease appears to have been due to the less prevalence of many epidemic diseases, such as Fevers—Small Pox—Diarrhœa and Dysentery; Cholera on the other hand prevailed extensively in various parts of the town, 573 deaths in excess of those registered in the preceding year being due to this disease.

3 The chief deaths from Cholera occurred in the 2nd Division (Peddoonaick's pettah, Big Parcherry—Uttapollium) and 6th Division (Vepery—New Town, Poorisawakum, Kilpauk, &c.), but all the divisions with the exception of the 3rd (Triplicane) exhibit an increase of mortality from Cholera, when compared with the returns of the former year.

4. The decrease of Cholera in Triplicane and its increase in the other Districts deserves some notice. The late improvements effected by the Municipal Authorities in opening out new roads to the sea, have possibly improved the salubrity of that densely populated quarter.

5. Under the head "Fevers" 1,510 deaths were registered in 1856, but in 1857 the number decreased to 764.

6. Small Pox appears to have been very much less prevalent, the number of deaths from this disease in 1856 was 789, in 1857—243.

7 Dysentery proved fatal to 731 persons in the past year In 1856, 939 deaths were registered under this head.

8. The population of Madras has been estimated at 720,000 The number of deaths registered during 1857, would give only a ratio of 9.67 per thousand—an exceedingly low death rate The Mortuary Reports of Bombay for some years past have shown that upwards of 14,000 persons die yearly in that city The population of Bombay has never been correctly determined, but it is supposed to be less than Madras. If this is the case, there can be no doubt that a large number of the deaths occurring in Madras are unregistered The great difference in the death-rate of the two Presidency towns, can scarcely be accounted for in any other way.

9. The importance of a correct census for Madras need not be pointed out to Government The Mortuary Tables can be but of little value, until the population shall have been distinctly ascertained.

10. Many important particulars embraced in the accompanying tables are necessarily imperfect. The "*cause of death*" and "*age*" of individuals must as a matter of course be often incorrectly given. The proportion of "Still-born" and young children can scarcely be expected to appear in these returns, as there can be but little doubt that the practice of burying such infants within the precincts of dwelling houses, still prevails in Madras. This practice should be put a stop to, not only on account of the registration of deaths, but because it increases facilities for the commission of the crime of infanticide, and is moreover injurious to the living, by polluting the atmosphere of the dwelling houses.

11. The Mortuary Returns for 1858 now in course of preparation, will show a total of 11,050 deaths—or 4,082 in excess of those in 1857.

MORTUARY REPORT

FOR THE YEAR 1858.

Registered deaths in 1858. 10,148
Average do. for 1855, 1856, 1857.. 8,676
1,472

THE number of deaths registered during the year, exceeded the average of the three years 1855-56-57. by 1,472, as shown in the margin.

2. A severe cholera epidemic prevailed in all the districts of Madras during the year 1858. The greatest number of deaths from this cause occurred in the month of January, when it proved fatal to 433 persons. The disease subsided gradually, and in April only 28 deaths were registered. In May, the deaths rose again to 116; and although the months of June and July show a somewhat diminished rate of mortality, the epidemic increased steadily; and in December, 249 persons died of it; 1,965 fatal cases of cholera were registered during the year.

3. The mortality has been heavier than usual in all the Police districts, excepting "Big Partcherry" (2nd part of "B division)," and "Royapettah" (part of D division), where very few deaths from cholera occurred. The largest number of deaths occurred in Poodonaick's pettah, forming a portion of the B division. The mortality was also high in Vepery, Choolay, Pursewakum, Perambore, Washerman's pettah, and Royapooram. All these districts are more or less deficient in drainage, ventilation and a wholesome supply of drinking water.

4. It is very unsatisfactory to have to report that, notwithstanding the facilities for the diffusion of vaccination amongst the inhabitants of Madras, the deaths from small-pox should be so numerous. There are no fewer than nine* public vaccinators, and yet small-pox almost constantly prevails in some parts of the town. The deaths registered from this cause during the four years in which a register has been kept, are as follows :—

2 First class.
4 Second class.
2 Third class.
1 Volunteer.

1855	852
1856	789
1857	243
1858	475
Total.....	2,359
Yearly average....	590

5. In the past year, the mortality from small-pox was highest in the four months, January, March, April, and May; and after the latter month, it began steadily to decline. It has been observed by Dr. Leith, in his Mortuary Report for Bombay, dated 1857, that small-pox occasions the greatest mortality in that town during the first six months of the year; and the observation holds good with regard to Madras for the short period during which tables of deaths have been regularly kept.

6. The per centage of deaths from small-pox amongst the various class of inhabitants, during the past year, was as follows :—

Europeans and East Indians	2·51
Hindoos (all castes)	5·03
Mahommedans	3·61

It may be surmised from the above figures, that no class of the community is thoroughly protected by vaccination. The mortality is lowest amongst Europeans and East Indians, as might have been expected, from their acquaintance with the prophylactic powers of vaccination; but there is still much room for improvement in this respect. If vaccination were enforced by law, the death-rate for small-pox would be exceedingly small, instead of being 0·81 to every 1,000 of the estimated population, as is now the case.

7. The total of deaths registered under the head "Fever," was 1,896; which is somewhat above the average of the former three years.

Deaths from Fever.

1855	1,729
1856	1,510
1857	764
Total	4,003
Average	1,334
1858	1,896
Difference	562

The mortality under this head, it will be observed, has varied considerably in the four years since the present system of registration has been in force; but it does not appear that seasons or temperature have influenced it to any great extent. There is a slight decrease in the month of April (at which period the small-pox mortality attains its maximum), and a slight increase after the heavy rains of the north-east monsoon (in November, December and January), but the variations are not sufficiently marked, nor have the years of observation been sufficient, to warrant any deductions being made for the circumstances noted.

8. It probably often happens that deaths are registered from "fever" when the febrile symptoms are only symptomatic of some internal lesion; and there are no means of obviating this source of error, arising as it does simply from ignorance, so long as the certificates of the cause of death are filled up and signed by the friends of the deceased. Medical men, Apothecaries, Dressers, &c., practising at the Presidency, would be doing good service to the cause of registration by correctly filling up the blank printed death-certificates in all cases attended by them.

9. It is a question for the consideration of Government, whether more stringent rules are not required for the management of burial and burning grounds. The present system appears to admit of hasty interment or incremation, without affording any particulars whatever relative to the deceased. Almost every weekly register shows that two or more persons whose names and diseases are unknown, are buried or burned without inquiry or inquest. It would be very desirable that inquests should be held in all cases where the cause of death has not been certified by a Medical practitioner, European or Native, or some other responsible person, if it could be managed, after due notice being given of the proposed change.

10. In compiling the Mortuary Register for 1859, the system of classification of diseases will be assimilated to that of the Registrar General of England in his annual and quarterly reports of mortality. To mark the progress of epidemic and other diseases amongst the inhabitants, a weekly summary of deaths from 1st January 1860, will be published in the *Gazette*, with occasional remarks regarding the prevalence or particular locality of epidemic diseases. In this manner the registration of deaths will be immediately useful to Medical officers, the Municipal authorities and Government, in pointing out the localities infested by epidemics, and drawing attention to the existence of defects in ventilation, drainage, &c., which may possibly have a direct bearing on the sanitary conditions of the neighbourhood.

11. In the last Mortuary Report for the year 1857, attention was directed to the very imperfect data on which the population of Madras has been estimated. It is hoped that efforts may be made in the approaching census year 1861, to obtain a tolerably correct return of the population. A correspondence on this subject with the Municipal Commissioners is appended for the information of Government.

(Signed) W. R. CORNISH,
Officiating Secretary to the Director General,
Medical Department.

MADRAS, *18th February* 1860.

No. 2341.

To THE MUNICIPAL COMMISSIONERS OF THE TOWN OF MADRAS,

GENTLEMEN,

I have the honor by desire of the Director General, Medical Department, to request your attention to the following observations in connection with the Mortuary Returns, furnished by you to this office :—

2. One of the principal objects contemplated in the framing of these returns was to show the death-rate of the population, arranged according to caste, race, and locality; but it is obvious that no trustworthy information on this head can be gained from the mortuary reports until a correct census of the whole population, and of the different localities, is obtained; and the Director General would be happy to learn your views regarding the best means of obtaining this desirable object.

3. Another object of considerable importance has not been hitherto attained, nor can it be, until the returns furnished by your department to this office are sent in *daily*—I allude to the weekly publication, for general information, by the local newspapers, as at Bombay, of a summary of the deaths occurring in the preceding week. By this arrangement the progress of epidemic diseases is traced, the unhealthy localities are immediately brought to notice, and sanitary defects may be at once pointed out and remedied.

4. The furnishing to this office daily the death-report for the whole Town would much facilitate the labor of tabulating and classifying the causes of mortality; and I am desired to request that you will be good enough, if possible, to assist in carrying out such an arrangement from the 1st January next. If the writer connected with the Mortuary department of your office would furnish me daily with a copy of the Death Register, there would be no difficulty in bringing the new system at once into operation. The practice alluded to is pursued at Bombay, and I append an extract of a letter from Dr. Leith, showing how much it facilitates his labors.

OFFICE OF DIRECTOR GENERAL,
MEDICAL DEPARTMENT,
Fort St. George, 21st December 1859.

(Signed) W. R. CORNISH,
Officiating Secretary to the Director General,
Medical Department.

EXTRACT.

"I may mention, that the duty of collecting the information regarding Deaths and Births, and registering them according to form, rests with the Police; but I see that all is done in order, and point out any irregularities to the Superintendent of Police. He sends me daily a register of the Deaths and another of the Births recorded on the preceding day; and then my more particular duty begins, viz., to have the items of information classified and tabulated.

"It is necessary to tabulate each day's register on its receipt, otherwise arrears would soon cause confusion."

(True Extract.)

(Signed) W. R. CORNISH,
Officiating Secretary to the Director General,
Medical Department.

Extract from the Proceedings of a Meeting of the Municipal Commissioners for the Town of Madras, under date the 23rd December 1879 :—

Read letter from the Officiating Secretary, Director General, Medical Department, dated 17th instant, requesting attention to certain observations in connection with the Mortuary Returns furnished by the Municipal Commissioners to his office, and soliciting that a copy of the Death-Register may be sent to him daily, instead of weekly.

RESOLUTION.

The Board observe, that the duty of taking a census properly devolves upon Government; and with regard to the Mortuary Returns, the particulars are not brought in by the Conicopolies daily, owing to the great distance they have to travel; consequently, it would be impossible to comply with this portion of the request; but the Board would not object to place the establishment under the Director General's orders, on the understanding that a copy of the returns is furnished to them for record.

(A true Extract.)
